

Appwonder is designed for an iphone/android app style website, it allows you to sell a product to your customer hitting all main points in one page with the nice smooth scroll to functionality included. This month we are happy to announce we have started incorporating CSS3 into our templates, we felt that since IE9 has been released now is a great time to start taking advantage of CSS3. Since IE7 and 8 don't support CSS3 natively we also addressed this and have included almost full CSS3 support for IE7 and 8. Included in the template is support for CSS3 in the older the internet explorer versions 7 and 8. With the release of 9 and it natively supporting CSS3 we have started to code and release more Shape 5 CSS3 compatible designs. The problem was that IE7 and 8 don't support CSS3 out of the box so we came across CSS PIE (Progressive Internet Explorer). Basically put, its a script that upgrades IE7 and 8 to support most CSS3 formatting. There are slight variations and some CSS3 formatting it doesn't support but overall it does a great job and allowed us to make the decision in switching over to CSS3 without sacrificing the user experience in IE7 and 8.
