

S5 Image Fader v3.0

Written by Administrator

Monday, 13 December 2010 23:47 - Last Updated Friday, 14 January 2011 23:57

The S5 Image Fader v3 brings a nice new list of features to our old image fader module. The new version runs off of mootools and allows you to use an unlimited number of images to rotate through. You simply select a directory on your server to pull images from and the module will pull and display all the images from that directory! You can choose from fade in/out, zoom/pan and slide for the transition effects between images. We still included the legacy option running of S5 Effects if you need to run the older version of this module.

All images used in Photofolio are Copyright 2011 W Pierce Photography at <http://www.wpiercephotography.com>

The screenshot shows the 'Module Parameters' form for the S5 Image Fader v3.0. It includes fields for Pre-Text, Module Class Suffix (set to -shadow_border), Height (487), Width (833), Tween Time (0.75), Display Time (3), and Background Color (151515). There are radio buttons for 'Version 2.0' (selected) and 'Legacy 1.0'. A note states: 'If using version 2.0 fill in details below, if version 1.0 click the "other" bar below to enter in image urls etc for version 2'. The 'Image directory path' is set to 'images/imagefader'. There are checkboxes for 'Enable Thumbnails', 'Enable Player Controls', and 'Enable Image Overlay', all of which are checked. A dropdown menu for 'Choose your effect style' is open, showing options: 'Fade', 'Zoom and Pan', and 'Slide'. A link for 'Other Parameters' is at the bottom.

Tutorial:

1. First off you'll need to get your images uploaded to a directory on your server. In the admin of the module you'll need to put relative path to your images. For example if you have your images stored here: <http://www.myserver.com/images/> then the relative path would just be "images" in the admin of the module.

2. Next is naming your images. The only part that matters for this module is that right before your image extension (.jpg, .gif, .png) is that you include an "m" for main image. If you are using thumbnails you'll need to include "mt" for main thumbnail.

3. The next thing to note is that your images will be pulled no matter what you include before the "m" and "mt" so you could name them: testm.jpg and testmt.jpg for the first image and checkitm.jpg and checkitmt.jpg for the second image and the fader will pull them. This is ok if you don't need an ordering to your images but if you do then name them as follows:

0_0m.jpg
0_1m.jpg
0_2m.jpg

And so on for the first ten, now the next ten you must prefix with 1 so that all the next ten stay in the number 1 set. The first number depicts the set and the second number is the image in that set, for exmple:

1_0m.jpg

1_1m.jpg

1_2m.jpg

Image Fader Legacy Mode:

This version is powered by S5 Effects. This means you will not receive any conflicts with other javascript libraries your template, modules or components might be using. The image fader will rotate between 10 images. Choose either the fade in effect which fades each picture into the next one, or choose the fade in/fade out effect.

Fade in Mode:

- 100% powered by S5 Effects (no script conflictions)
- Specify height and width of images
- Up to 10 images able to rotate at one time
- Set background color
- Set how fast the image fades (tween time)
- Set how long the image displays before fading
- Includes slide selector buttons

Fade in/Fade out Mode:

- 100% powered by S5 Effects (no script conflictions)
- Specify height and width of images
- Up to 10 images able to rotate at one time
- Set background color
- Set how fast the image fades (tween time)
- Set how long the image displays before fading
- Enable or disable Mootools image reflections
- Each image slide can have its own hyperlink
